EDUCATION

- **SRM IST** Chennai, India
B.Tech. in Computer Science and Engg; GPA: 8.18 *July 2017 - June 2021*

SKILLS SUMMARY

- **Languages:** JavaScript (ES6+), TypeScript
- **Frontend:** React, Redux, HTML5, CSS3
- **Performance:** IndexedDB, Client-side Caching, Memoization, Lazy Loading, Virtualization, Render Optimization, Web Performance
- **Testing:** Jest, Cypress, Karma, Mocha
- **DevOps:** GitLab CI/CD, Kubernetes
- **Developer Tools:** GitHub Copilot, Claude, Devin

EXPERIENCE

- **Goldman Sachs** Hyderabad
Software Engineer — Front-End *June 2025 - Present*
 - Architected a configurable **proxy-based development framework** for React applications, enabling seamless switching between live QA APIs and mocked responses with selective overrides. Improved integration testing, accelerated bug reproduction, and substantially reduced environment-specific defects reaching QA and production.
 - Drove **React performance optimization** across large-scale enterprise applications by profiling rendering behavior, eliminating unnecessary state updates, introducing memoization (**useMemo**, **useCallback**), optimizing component lifecycle, and restructuring component hierarchies to improve responsiveness, scalability, and maintainability.
 - Resolved a critical frontend performance bottleneck by preventing redundant execution of over **700 API requests** through **optimized state management** and component lifecycle, significantly reducing unnecessary backend traffic while preserving intended data loading behavior.
 - Redesigned data loading for a deeply nested enterprise grid handling over **100k records** by introducing **IndexedDB caching**, client-side persistence, reusable data access patterns, and controlled rendering strategies, reducing data retrieval latency and improving perceived page load performance by approximately **40%**.
 - Built reusable frontend infrastructure including **custom React hooks** for standardized API communication, shared utilities, and reusable abstractions, improving code reuse, simplifying asynchronous state management, and accelerating development across multiple enterprise applications.
 - Designed and developed a **Maker-Checker governance platform** supporting **50+ users** and over **1k approval requests** with RBAC, audit logging, and request consolidation, reducing approval turnaround time by **40%**.
 - Served as the **sole Frontend Engineer** across the Bangalore and Hyderabad Client Onboarding team, owning frontend architecture, technical design, performance optimization, engineering standards, code quality, and UI delivery across multiple business-critical applications.
- **Oracle** Hyderabad
Software Engineer — Front-End *Jan 2021 - April 2025*
 - Led modernization of **30+** legacy enterprise applications (RACC → RAPID), driving architectural upgrades that improved application performance by approximately **30%** while reducing unnecessary UI re-renders by **80%** (10 → 2).
 - Engineered **40+** enterprise web applications and **30+** reusable React/OJET components, supporting Oracle Hospitality platforms used by global customers.
 - Architected and deployed a shared proxy configuration framework adopted by **60+ teams**, standardizing environment-based API orchestration, simplifying local development, and improving UI performance by approximately **80%**.
 - Conducted over **600 code reviews** while modernizing frontend testing (Jest, Cypress) and CI/CD pipelines, improving engineering quality, deployment reliability, and frontend development standards across multiple teams.

PROJECTS

- **A SURVEY AND IMPLEMENTATION ON ANALYZING COVID-19 VACCINES ON TWITTER DATASET USING TWEEDY AND TEXT BLOB** - *Annals of the Romanian Society for Cell Biology*: This paper depends on utilizing Twitter for sentiment analysis of the views of people on COVID-19 vaccines and eagerness to have the jab. **Tweedy** and **TextBlob** libraries were used to implement the analysis for people to have a detailed idea of what vaccination to go for. Analysis can consider around **1,00,000** tweets in a single run to give precise information.
- **BEECLUST MULTI-ROBOT SYSTEMS LAB - Head Computer Vision**: Guided a team of **8 members** and developed the design for swarm printers using **Python, OpenCV along with April tags and overhead cameras**. Aim was to reduce human interaction in warehouses and to achieve fast and hassle-free handling of goods by approx 200%.
